TARGET: Enterprise Customer Success · Technical Account Management · Technical Program Management

Dear Hiring Manager,

I wrote my first automation script in 1999, at eight years old, for a game called EverQuest. I never stopped building. But my career took shape somewhere more valuable: the seam between deep technical work and the customer across the table.

I studied Computer Science & Information Systems at UVU; an auto-auction job paid for school. Ten years later I was the General Manager, refactoring the entire Java-based auction stack and running the website while still working the floor — hundreds of cars a week. Sales grew year over year for a decade, on software I rebuilt, campaigns I created, and inventory I fought for: new dealer and bank accounts, even working with local law enforcement on repossessions. And I sold cars myself — sell someone one car, and they'd bring their entire family back. That is what trust is — not a pitch, but small deposits with the same people, week after week. We called it customers for life.

At Black Box Code I became the engineering side's guardian. I absorbed complex client architectures fast and jumped in front of the train so architects and developers could stay focused on scope, TDD, and clean delivery. At SMPL Finance I ran enterprise complexity as Senior Project Manager: procurement, resourcing, shifting scope, clear reports for decision-makers. I know how it feels to deliver on a deadline because the campaign is already live and the runway is finite. When I sit with a customer's project owners, I am not sympathizing. I have been them.

In 2023, right as GPT arrived, I dove headfirst into the AI shift, building my own coding agents and task-management systems from the ground up at Sentry Mandate — full days, most nights, for three years. Those dreams will live on happily in my garage. What I want now is a good home: a team where all of that building goes into helping other companies choose their future instead of reacting to it.

I have owned the P&L, engineered the stack, and shipped the product. The relationship is the part I have practiced my whole life.

Thank you for your time and consideration.

Sincerely,

Jared F. Helm

Executive Résumé

jaredfhelm@gmail.com · 385-237-5056 · linkedin.com/in/jaredfhelm · github.com/jaredfhelm · sentrymandate.com

I built a career refusing to choose between the codebase and the customer.

EXPERIENCE

Founder / AI Operations Specialist

2023 - PRESENT

Sentry Mandate LLC & Independent Consulting

Left corporate delivery the year GPT arrived and founded Sentry Mandate at the front edge of the AI shift, combining a lifetime of operations and customer relations with the new machines. I build my own coding agents and the proof-gated systems that run them. **SHIPPED:** AIOS, tinygate, Daughters of Courage, The Cockpit, Microsoft Atlas, Piper, tbot, gritty, El Niño, Blue Dragon (page 4).

Senior Project Manager

2021 - 2023

SMPL Finance

Walked into a financial product moving faster than its process: scope shifting weekly, executives and engineering each holding their own version of the truth. Took over program governance — procurement and vendor coordination, resource management, risk and dependency tracking — and put both sides on one set of business and technical reports. Release, marketing, and compliance milestones stopped colliding.

Technical Project Manager

2018 - 2020

Black Box Code

Clients came to us when their own stack had become the enemy, and we rebuilt it from the inside out. I orchestrated client and internal engineering as one unit, tailored task-management systems and automations to each engagement, and jumped in front of the train so architects, developers, and designers never felt the scope churn. Engineers kept their focus, TDD took root, and delivery dates held.

General Manager & Lead Systems Engineer

2008 - 2018

Auto Auctions of America

Joined to pay for school (UVU CSIS); stayed a decade and rose to General Manager, hiring and leading the floor and office teams. Increased sales year over year for ten straight years — refactoring the aging Java-based auction software and website, running creative advertising, winning dealer and bank accounts, and selling on the floor myself. Hundreds of cars a week: customers for life, built on radical trust.

Early Experience

EARLY

Mrs. Fields Cookies (Corporate) · Sizzler

Corporate catalog sales and strategic account acquisition at Mrs. Fields HQ; Sizzler host/server at fifteen — working, selling, and serving ever since.

PROFILE

Lifelong technical builder, career spent customer-facing — from a decade on a live auction floor to enterprise software delivery. Writing code since 1999; selling and serving since fifteen.

Ownership is my empathy: I have carried payroll, runway, and launch dates, so I understand the account owner across the table — and I can read their stack as fluently as their P&L.

BEST-FIT ROLES

- Customer Success Account Manager
- Technical Account Manager
- Solutions Lead
- Technical Program Manager
- Senior PM

CORE STRENGTHS

- Relationship Building
- Stakeholder Alignment
- Escalation Shielding
- Executive Reporting
- Technical Deep Dives
- AI Automation

EDUCATION

Utah Valley University (UVU)

Computer Science & Information Systems (CSIS)
· Classical OOP coursework

THE SEAM I LIVE ON

Most careers pick a side: technical or customer-facing. Mine never did. Every chapter — auction floor, engineering shop, finance PMO, AI lab — has been both at once. That seam is where enterprise accounts are won and kept.

WHY CUSTOMERS TRUST ME WITH THEIR ACCOUNTS

Trust at a live auction is earned in public: same floor, same faces, week after week, with money on the line. Ten years of that builds a reflex — never let the person across the table be surprised. As the face of a company, I bring bad news early and with a plan, translate the roadmap into their outcomes, and stay accountable long after the signature.

- Face-of-the-company presence, earned on live auction floors
- Escalation shield: problems find me before they find the team
- PM instincts — deadlines exist because campaigns and budgets do
- Owner's empathy — I know what runway and payroll feel like
- Fluent in complex specs, architectures, and security postures
- Builder: I can prototype the fix, not just file the ticket

HOW I RUN AN ACCOUNT

I do not win by sounding technical, and I do not win by charm. I win when the customer does — by making their success legible to both sides, their executives and our engineers, until delivery, renewal, and expansion stop being separate conversations.

- LISTEN** **Learn what they are actually carrying.** Not the org-chart version — revenue targets, campaign dates, budget runway, and the people whose jobs depend on delivery.
- TRANSLATE** **Bridge the two languages.** Technical specs into business outcomes for their executives; business pressure into precise, respectful asks for our engineers.
- DELIVER** **Make trust compound.** Program reviews, delivery cadence, honest status, early escalation, and proof — so every renewal conversation starts from evidence, not persuasion.

OPERATING THESIS

The account everyone else calls difficult is usually the one nobody has listened to. The tangled stack, the shifting scope, the stakeholders who have stopped believing — I learn the business, earn a seat at the table, and the relationship outlasts the contract.

WHAT I BRING INTO THE ROOM

Customer & Account Leadership

Relationship Building

Strategic Account Acquisition

Customer Success Planning

Delivery Orchestration

Discovery & Demos

POCs & Onboarding

Security Questionnaires

Escalation Management

Executive Briefings

CRM Handoffs

Program & Delivery Leadership

Technical Program Management

Program Governance

Cross-Functional Orchestration

Team Building

Budgeting & Procurement

Vendor Management

Resource Management

Risk & Dependency Management

Stakeholder Alignment

TDD & Agile Cadences

AI / Systems Automation

LLM Agents

Tool-Calling

RAG / Embeddings

Model Routing

Context Engineering

Proof-Gated Automation

Multi-Agent Debate

Evaluation Flows

Approval Gates

Dashboards / Internal Tools

Engineering / Tools / Stack

TypeScript

Python

Rust

Java

Node.js

Next.js / React

PostgreSQL

SQLite

REST APIs

Docker

AWS

Cloudflare

Railway

Playwright

BUILT IN THE LAST THREE YEARS

AI made everyone fast; the edge is AI you can actually trust. Engineers extend that trust to people who have done the work — shipped, benchmarked, some of it in production today.

AIOS — my swing at what the operating system becomes next PLATFORM

What Windows and macOS look like after AI: agents doing real work under real accountability. 1,100+ skills, a typed capability graph, one rule — **work is finished when the test passes, not when the AI says so.**

Daughters of Courage AUTO-RESEARCH

Autonomous cancer-research system — 18 specialist AI “brains” write evidence-graded, PubMed-cited theses (367 canonized) and debate to consensus under an AI arbiter, giving patients calm, sourced answers.

The Cockpit LEAD-GEN

Vehicle-lead operating system — de-dupes cross-posted listings into one canonical vehicle, then a deterministic state-machine outreach funnel. AES-256-GCM-vaulted PII, every reveal audited. In production.

tinygate MIT · OSS

One-file, zero-dependency proof gate for AI agents — “done” means a stored proof command exiting green. Cut tokens 32% at matched quality on a 100-task benchmark.

Piper / tinypiper AGENT

Hybrid AI agent distilled to one ~130-line file — deterministic routing: no-LLM instant answers where possible, local models next, cloud only when needed. Sandboxed tools.

Microsoft Atlas GRAPH

Zero-dependency Node.js knowledge graph of Microsoft’s org — deterministic content-addressed ingestion, graph-native BM25 retrieval (no vectors), WebGL2 topology UI, read-only self-fact-checking assistant.

tbot TRADING

Pure-math Rust market maker for Polymarket crypto contracts — 20 crates pricing fair value in nanoseconds, no LLM. 67% win rate in months of simulation against live market data; held from real trading for compliance.

gritty RUST

Native Windows terminal multiplexer in Rust, rendered on CPU — no GPU, no Electron. Tabs, splits, session restore in a sub-800 KB binary.

El Niño FORECASTING

Deterministic ENSO→commodity forecasting engine — every prediction sealed in a write-once ledger and graded against reality; a single as-of gate makes future-data leakage impossible.

Blue Dragon Coins E-COMMERCE

E-commerce company I built end to end — a Rust live-commerce trust stack: SHA-256-locked pack manifests, append-only audit ledger, custody reconciliation across public site, buyer app, and admin.

AI operations, project leadership, and business execution are no longer separate lanes. The companies that win will be the ones that never forget the human on the other side of the table – and build the systems that support them.
